DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-9, 10-15 are rejected under 35 U.S.C. 102(e) as being anticipated by Watanabe et al. (6,451,482).

Watanabe et al. teaches in column 9, lines 57-58, that the organic solution may be a polymer solid electrolyte and teaches in column 10, claim 1, a non-aqueous electrolyte secondary battery comprising a positive electrode comprising a lithium containing metal oxide; a negative electrode and a solid electrolyte layer. Watanabe et al. teaches in column 5, that the positive electrode comprised a paste comprising of $\text{LiNi}_{0.85}\text{Co}_{0.15}\text{O}_2$ which is applied to both sides of an aluminum foil. Watanabe et al. teaches in column 4, lines 33-47, that the metallic lithium is deposited on the surface of the negative electrode and in column 6, lines 50-58, that after the

experimental charge and discharge cycle showed a glossy deposit of metallic lithium on the negative electrode.

3. Claims 1-8 are rejected under 35 U.S.C. 102(b) as being anticipated by Lee et al. (5,952,126).

Lee et al. teaches in column 1, lines 33-40, that lithium compounds typically used as cathode ~~anode~~ material include lithium cobalt oxide, lithium nickel oxide or lithium manganese oxide and that lithium compounds employed as an anode material include metallic lithium, lithium alloy or carbon and that a solid electrolyte can be used.

4. Claims 1-8 are rejected under 35 U.S.C. 102(e) as being anticipated by Takada et al. (6,322,929).

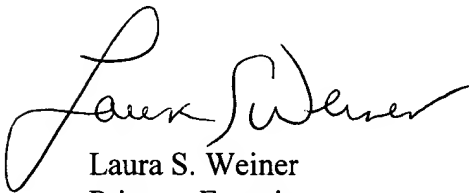

Takada et al. teaches in column 6, a battery comprising a positive electrode material which could be $\text{Li}_{1-y}\text{NiVO}_4$ or $\text{Li}_{1-y}\text{Mn}_{2-x}\text{Ni}_x\text{O}_4$, etc, a negative electrode comprising a metallic lithium and an amorphous solid electrolyte.
